Memo to File:

Re: Ken Wright
Grizzly Claims 1-50
Millard County
DOE/027/001

This calcite quarry was inspected by Ron Daniels and Jim Smith on the 12th of July 1978. There was no sign of any recent activity, with no apparent change having taken place since the last inspection on Nov. 5, 1976.

The surface disturbance consisted of one (1) small pit and a portion of the hillside which appeared to have been excavated then semi-regraded. There were some scattered piles of calcite and miscellaneous junk. The total disturbance would probably amount to an area just under two (2) acres.

Vegetation in the area consists of big sagebrush, black sagebrush, rabbitbrush, ephedra, cactus, bluebunch wheatgrass, Indian ricegrass and basin wildrye. The soils belong to the Lithic Xerollic Calciorthids - Xerollic Calciorthids Association.

A letter should be sent to Mr. Wright to inquire about the status of this operation.
